

Accounting Change:

What It Breaks in the Mobile App

A plain-English review of the Clozr mobile app against the NexoCRM Accounting-Readiness change, written for people who need to decide what to fix and in what order.

Reviewed	The entire mobile app - every screen, not a sample
Checked against	The live development backend, not just the change document
App version	1.0.0 (build 7)
Date	21 September 2026
Changes made	None. This is a report only.

The one-minute version

The backend team did this change carefully. Nothing crashes, no screen fails to load, and no data is lost. That is genuinely good news and it is not faint praise.

But "nothing crashes" is not the same as "everything is correct". Two things are showing wrong information on screen today, and several more will go wrong the moment someone starts using the new accounting features.

The headline problem

Every quote line in the mobile app shows a quantity of 1 - no matter what the real quantity is.

This is not theoretical

We checked 29 quote lines in the live system. 22 of them - 76% - have a quantity that is not 1. Some are large: one line is for 500 units, another for 250.

A salesperson opening quote QTN-00055 sees "Qty 1" beside a line worth Rs 37,500 that is actually 250 units. The quantity and the price do not multiply to the total sitting next to them.

The good news inside the bad news: the money totals are still correct. Only the quantity is wrong. But on a screen a salesperson uses in front of a customer, a number that visibly does not add up damages trust in the whole app.

Why this happened

The accounting change allowed quotes to have fractional quantities - 2.5 hours, 1.5 licences. To support decimals, the backend changed how it sends the quantity: it now arrives as text ("1.000") rather than as a plain number.

The mobile app was written to read a plain number. When it receives text instead, it quietly gives up and falls back to its default value of 1. It does not complain, does not show an error, and does not skip the line. It just shows the wrong number.

The pattern worth understanding

This is the shape of almost every problem in this report. The backend change is backward-compatible, so nothing explodes. Instead, the app quietly falls back to a default, ignores a field it does not recognise, or displays a figure that no longer means what it used to mean.

These are harder to spot than crashes, because nothing looks broken. Somebody has to notice the number is wrong.

How we classified everything

Label	What it means
Live	Wrong on screen right now, today
Armed	The code is wrong, but nobody has triggered it yet. It goes wrong the first time someone uses the new field.
On go-live	Breaks when the accounting module is switched on
Gap	Not broken - the app simply cannot use a new capability the backend now offers
Pre-existing	A real problem we found while looking, but NOT caused by this change

What needs fixing

In priority order. "Effort" is a rough engineering estimate: Small is under a day, Medium is a few days.

Fix before anything else

#	Problem	When	Effort
1	Quote lines all show "Qty 1"	Live	Small
2	Adding a product fails if the HSN/SAC code is not purely numeric	Live	Small
3	Total, Paid and Balance stop adding up once tax is withheld	Armed	Medium
4	A settled instalment shows the cash received, not the amount owed	Armed	Medium

Fix soon

#	Problem	When	Effort
5	The new-quote form cannot accept "2.5" - it silently sends 1	Live	Small
6	Quotes created on mobile carry no tax information at all	Live	Small
7	"Tax Invoice" will appear in the quote template list for new companies	On go-live	Small
8	An Accountant user gets an empty menu and an unusable app	On go-live	Medium
9	No way to record tax withheld when marking a payment as paid	Gap	Medium

Fix when you can

#	Problem	When	Effort
10	Accounting refusals are shown, but the app cannot react intelligently	On go-live	Small
11	Support tickets cannot be marked billable	Gap	Medium
12	No warning when a product uses a retired GST rate (12% or 28%)	Gap	Small
13	Product "nature of supply" - blocked, the backend has not exposed this field yet	Blocked	-
14	The list of Indian states for "place of supply" is not connected	Gap	Medium
15	Per-line discounts are ignored, so the line maths looks wrong	Armed	Small
16	Quote totals are always labelled "tax-free", which may become untrue	On go-live	Small
17	Product tax calculations may drift from the accounting rate master	On go-live	Small
18	Projects cannot be linked to a quote, and show no financial summary	Gap	Medium

Eleven smaller items are listed in the engineering document. None of them affects what a user sees today.

The four urgent ones, explained

1 - LIVE TODAY

Every quote line shows "Qty 1"

Covered above. The fix is small and self-contained: teach the app to read a decimal quantity and show it properly. This is the highest value change in the whole report because it is the smallest fix with the most visible payoff.

2 - LIVE TODAY

Adding a product now fails on a non-numeric HSN code

The backend started checking the format of the HSN/SAC tax code. It now requires between 4 and 8 digits. The mobile app still offers a free-text box with no guidance and no checking, so anyone typing "n/a", a code with a space, or a code with letters gets a confusing error message after the save fails.

We tested this directly against the live system to establish the exact rule, rather than guessing from the document - which matters, because a rule that is stricter than the real one would block valid codes and be worse than the original bug.

- Leaving the box empty is still fine - the app drops it and the save succeeds.
- There is no "edit product" screen in the app, so creating a product is the only place this bites.

3 & 4 - ARMED, NOT YET FIRING

The payment screens will stop adding up

Indian business payments often involve tax withheld at source. A customer owing Rs 1,00,000 may pay Rs 90,000 and withhold Rs 10,000 as TDS. The instalment is fully settled - the money is simply split between cash and tax credit.

The backend now understands this. The mobile app does not. It reads no tax-withheld field at all, so it cannot explain the gap even if it wanted to.

What the user will see

On the invoice screen: TOTAL Rs 1,00,000, PAID Rs 90,000, BALANCE Rs 0. Three numbers that visibly do not reconcile, with nothing on screen accounting for the missing Rs 10,000.

On the instalment row: the amount switches to Rs 90,000 with a green "Paid" tick against an instalment that was for Rs 1,00,000. Add up the schedule by hand and it no longer matches the invoice total.

Nothing is wrong yet, because no payment in the system currently has tax withheld. It goes wrong the first time anyone records one - from the web app, the API, or an import. This is why it is urgent despite not being visibly broken today.

What is already safe

Worth stating clearly, because these are the things people usually worry about first - and we checked each one properly rather than assuming.

- Nothing crashes. Every part of the app that reads data from the backend was written defensively and copes with new, missing, or empty fields.
- No screen fails to load, and no data is lost.
- The seven new accounting permissions the backend now sends are handled safely. They do not crash the app and they do not add stray entries to the menu.
- Money amounts are read correctly everywhere. The quantity field was the single exception - that is problem 1.
- When the accounting module refuses an action, the app already shows the backend's explanation to the user. That happens to work rather than being designed, but it works.
- The app never writes to any of the fields accounting is taking ownership of, so there is no risk of it fighting the accounting module for control of a number.
- Project screens never displayed profit or margin figures, so accounting taking over those numbers changes nothing in the app.
- Nothing in the offline cache breaks, in either direction.

A note on the change document

The document has three small inaccuracies we confirmed against the live system. Two matter:

It gives the wrong web address for the quote-template list. The app already uses the correct one - so "correcting" the app to match the document would break a working feature.

It lists a product field (nature of supply) as available now. It is not there yet, so that piece of work is blocked until the backend exposes it.

Problems we found that are NOT from this change

While reviewing every screen we found several existing faults. They are unrelated to accounting, but two are serious and visible today, so they belong on the same work queue.

Problem	Impact
Every invoice and payment row shows a dash instead of the customer name	Serious. The "Customer" button always says no customer is linked, even when one plainly is. Customer search and filtering on those screens do not work at all.
Every invoice card shows "0/0 settled" with an empty progress bar	High. The progress bar on the invoice list is permanently empty. It went unnoticed because the invoice detail screen gets its figures from elsewhere and looks right.
The "Estimated cost" filter on Projects returns nothing	High. Raising the minimum above zero empties the list, even though matching projects exist.
Three smaller issues	Cached projects lose two fields; tapping a saved-view chip can fail if the list changed; a mock-mode field name mismatch.

Suggested order of work

Round 1 - stop showing wrong numbers

Quote quantities, the HSN code box, customer names on payment rows, the invoice progress bar, and the new-quote form's handling of decimals. All small, all immediately visible to users.

Round 2 - before anyone records withheld tax

The payment settlement maths, and the ability to record tax withheld and bank charges. Also start attaching product information to quote lines, because every quote created without it is permanently missing its tax details and cannot be fixed later.

Round 3 - before accounting is switched on

Hide the Tax Invoice template from the quote picker, give Accountant users somewhere to land, handle accounting refusals properly, and fix the tax-free label.

Round 4 - new capabilities

Billable tickets, the retired-GST-rate warning, the state list for place of supply, and project-to-quote links.

One thing that would prevent several of these

Two of the highest-priority problems exist because quotes created on mobile are structurally poorer than quotes created on the web - they carry no product link and therefore no tax information. Every day that continues adds records that cannot be invoiced properly later and cannot be repaired retroactively.

If only one thing from Round 2 gets done, make it that one.

Three questions for the backend team

These cannot be answered from the app, and one of them changes how urgent a fix is.

- When a quote is created without saying whether prices include tax, what does the system assume? If it assumes prices INCLUDE tax, then every quote created on mobile is being stored about 18% too low, and that becomes the most urgent item in this report. This is the one genuinely open risk.
- When will the product "nature of supply" field actually appear? It is described as available but is not there yet, and that work is blocked until it is.
- Is the product category name still being sent? If not, category labels and filters are silently empty on the live system.

Separately, worth flagging: some dashboard figures are ranked using a project column that this change marks as retired. Those will need re-pointing at the accounting ledger, or the numbers will quietly fall to zero. Nothing the mobile app can do about it.

The companion document ACCOUNTING_CHANGE_IMPACT.md contains the same findings with exact file locations, code-level explanations and step-by-step fixes for each item.
